Standard Specification for Thermoplastic Polyolefin Based Sheet Roofing

This standard is issued under the fixed designation D6878/D6878M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (e) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers flexible sheet made from thermoplastic polyolefin (TPO) as the principal polymer, intended for use in single-ply roofing membranes exposed to the weather. The sheet shall contain reinforcing fabrics or scrim.

1.2 The tests and property limits used to characterize the sheet are values intended to ensure minimum quality for the intended purpose. In-place roof system design criteria, such as fire resistance, field seaming strength, material compatibility, and uplift resistance, among others, are factors which should be considered but are beyond the scope of this specification.

1.3 The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standard.

1.4 This standard may involve hazardous materials, operations, and equipment. This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory requirements prior to use.

1.5 This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.

2. Referenced Documents

2.1 ASTM Standards:

D471 Test Method for Rubber Property—Effect of Liquids

D573 Test Method for Rubber—Deterioration in an Air Oven
D751 Test Methods for Coated Fabrics
D1149 Test Methods for Rubber Deterioration—Cracking in an Ozone Controlled Environment
D1204 Test Method for Linear Dimensional Changes of Nonrigid Thermoplastic Sheeting or Film at Elevated Temperature
D2137 Test Methods for Rubber Property—Brittleness Point of Flexible Polymers and Coated Fabrics
D5538 Practice for Thermoplastic Elastomers—Terminology and Abbreviations
D7635/D7635M Test Method for Measurement of Thickness of Coatings Over Fabric Reinforcement
G151 Practice for Exposing Nonmetallic Materials in Accelerated Test Devices that Use Laboratory Light Sources
G155 Practice for Operating Xenon Arc Light Apparatus for Exposure of Non-Metallic Materials

3. Materials and Manufacture

3.1 The sheet shall be formulated from ethylene and higher alpha-olefin polymers, copolymers, and mixtures thereof, in amounts greater than 50%, by weight of the total polymer content suitably compounded to satisfy the physical requirements in the specification (see Practice D5538).

3.2 The sheet shall be capable of being heat welded, fused, or adhesively bonded to itself for making watertight field splices and repairs, and the supplier or fabricator shall recommend suitable methods and materials.

3.3 Sheet shall be reinforced with fabric or scrim.

4. Physical Properties and Tolerances

4.1 Each sheet specimen shall meet or exceed the physical requirements prescribed in Table 1.

4.2 The tolerance for time conditions (aging, weathering, and so forth) is ±15 min or ±1% of the period, whichever is greater, unless otherwise specified.

4.3 The tolerance for temperature conditions (aging, weathering, and so forth) is ±2°C [±4°F] of the specified temperature, unless otherwise specified.

5. Dimensions and Permissible Variations

5.1 The width and length of the sheet shall be agreed upon between the purchaser and the supplier.

5.1.1 The width and length tolerance shall be +3 %, -0 %.

5.1.2 The thickness tolerance shall be +15 %, -10 % of thickness agreed upon by the purchaser and supplier, but in no case shall it be less than the minimum in Table 1.

5.1.3 The thickness of coating over scrim (reinforcing fabric) of the weathering side shall be at least 30 % of the overall thickness as agreed upon by the purchaser and supplier, but in no case shall it be less than the minimum in Table 1. The table below can be used as a reference for commonly used thicknesses.

6. Workmanship, Finish, and Appearance

6.1 The sheet, including factory seams, if present, shall be watertight and free of pinholes, particles of foreign matter, protruding fibers or reinforcement, undispersed raw material, nicks and cuts, voids, thin areas, delaminations or other manufacturing defects that might adversely affect serviceability.

6.2 Edges of the sheets shall be capable of being sealed to one another without fishmouthing.

7. Test Methods

7.1 Dimensions—Test Methods D751, after permitting the sheet to relax at 23°C [73°F] for 1 h.

7.2 Thickness, Sheet Overall—Refer to Test Methods D751.

7.3 Thickness of Coating Over Scrim (Reinforcing Fabric)—Test Method D7635/D7635M. Follow preparation procedures as specified in Test Method D7635/D7635M. The thickness measurements shall be conducted as described in the test method on the coating on the side intended to be exposed to the weather.

7.4 Breaking Strength—Test Methods D751, Grab Method.

7.5 Elongation at Break—Test Methods D751, Grab Method.

7.6 Tearing Strength—Test Methods D751, 2 in./min jaw speed. [8 by 8 in. sample size].

7.7 Brittleness Point—Test Methods D2137, Method B.

7.8 Ozone Resistance—Test Method D1149. Inspect at 7x magnification on specimens exposed to 100 mPa [1 x 10^-5 psi] ozone in air at 40°C [104°F]. Specimens shall be wrapped around a 75-mm [3-in.] diameter mandrel for 166 h exposure. Specimen shall be wrapped around the same size mandrel for inspection. The required specimen width is 25 mm [1.0 in.].

7.9 Heat Aging—Test Method D573. Sheet specimens are to be cut to a size of 5 by 15 cm [2 by 6 in.]. Three specimens are required. Unless otherwise specified, specimens shall be taken no nearer the selvage than one tenth the width of the sheet. Specimens shall be allowed to equilibrate to room temperature (Note 1) and then weighed within 6 h prior to heat aging using an analytical balance. Age sheet specimens for either (I) 5376 h (224 days or 32 weeks) at 116°C [240°F]; or (II) 1344 h (56 days or 8 weeks) at 135°C [275°F]. Provision shall be made for suspending specimens vertically without touching each other or the sides of the aging chamber. Aged specimens are then allowed to cool to room temperature, re-weighed and inspected at 7x magnification when bent over a 3 in. mandrel for surface cracking. The same specimen is used for both weighing and surface inspection and shall be evaluated within 4 h of removal from heat aging. Weight loss shall be expressed as the difference between the original weight and the aged weight, expressed as a percentage of the original weight to a precision of ±0.1 %. If any cracking or weight change above the maximum allowed change is observed in two or more samples, the test is a failure.

Note 1—Specimens can be preconditioned at standard laboratory conditions (23°C ± 2°C and 50 % ± 5 % relative humidity) for 24 h.

7.10 Linear Dimensional Change—Test Method D1204. Age specimen for 6 h at 70°C [158°F] or 1 h at 100°C [212°F].

7.11 Water Absorption—Test Method D471 for 166 h at 70°C [158°F]. Test performed on top coating material only. (Use Test Method D471, Procedure for Change in Mass.)

7.12 Factory Seam Strength—Test Methods D751, Grab Method. Modify procedure by cutting a 25 mm [1.0 in.] wide by 300 mm [12 in.] long sample across the lap seam. Place in jaws approximately 50 mm [2.0 in.] from edges of the overlap area and test at a jaw separation rate of 5 cm/min [2 in./min].

7.13 Weather Resistance—Accelerated weathering tests shall be performed using Practice G155.

7.13.1 Practice G151 and G155—Xenon-arc apparatus shall be operated in accordance with the following conditions:

<table>
<thead>

<td>The maximum allowable operational fluctuation of the irradiance setting is ±0.02 W/(m² · nm).</td>
<td></td>
</tr>
</tbody>
</table>
9. Rejection and Resubmittal

9.1 Failure to conform to any one of the requirements prescribed in this specification shall constitute grounds for rejection. Rejection shall be reported to the supplier promptly and in writing. The seller shall have the right to reinspect the rejected shipment and resubmit the lot after removal of those packages not conforming to the specified requirements.

10. Product Marking

10.1 The sheet shall be identified on the side intended to be exposed to the weather with this ASTM designation and either the name of the manufacturer or supplier or TPO. The type of identification is at the manufacturer’s option. Such identification shall occur at intervals not to exceed 3 m [9 ft, 10 in.] in the long direction. The identification shall be applied in such a manner as to be legible five years from installation. Identification shall not be required when so specified by the purchaser.

11. Packaging and Package Marking

11.1 The material shall be packaged in a standard commercial manner, unless otherwise specified, so as to be acceptable by commercial or other carriers for safe transportation to the point of delivery.

11.2 Shipping containers shall be marked with:

11.2.1 The name of the material,

11.2.2 Product code,

11.2.3 ASTM number,

11.2.4 Size or quantity, and

11.2.5 Name of manufacturer or supplier.
